Manually mount a network drive in Mac Os

(If you wish to store data in the cloud and access it from a network drive)

[Create your NetExplorer platform](#)

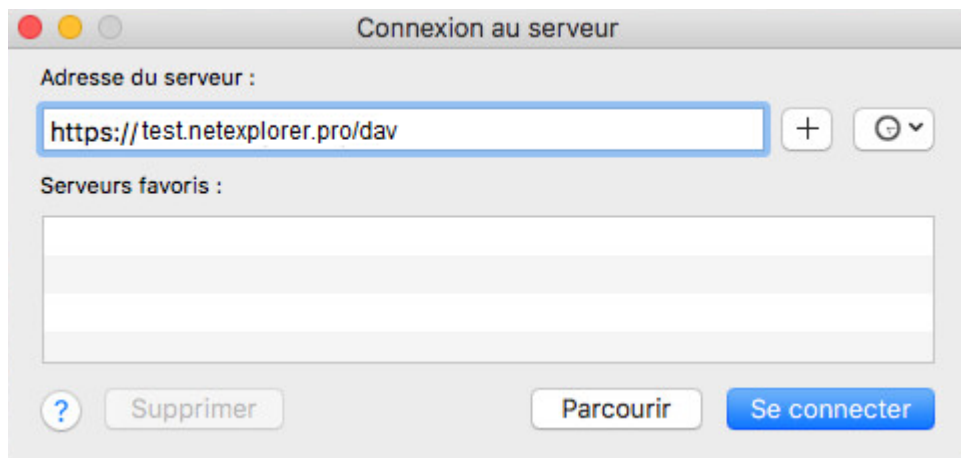

You wish to install a network drive on your Mac and easily access your data stored on the NetExplorer.

For this :

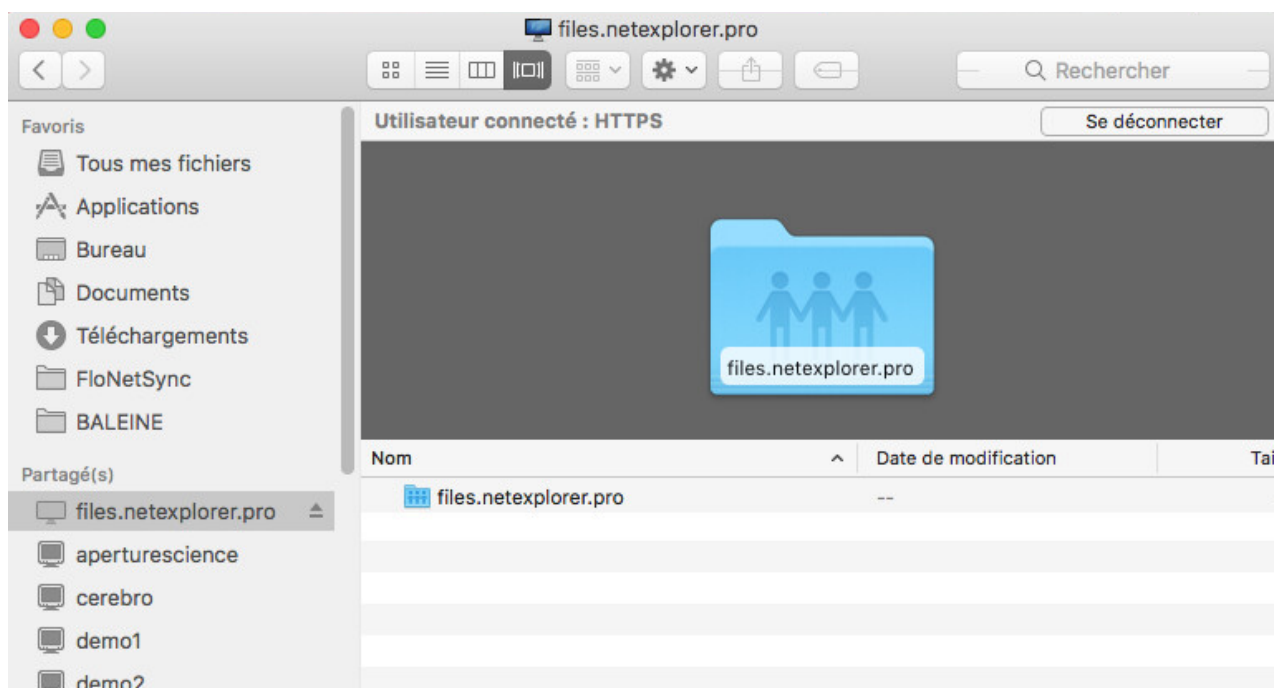

- **Open Finder.** Select ALL then **Connector to server...**
- **In server address,** type url of platform followed by "/dav"

(You should get an url like <https://nomdelaplateforme.netexplorer.pro/dav>)

- **Click on Connect.**
- **Type your credentials in the fields NAME and PASSWORD,** (as shown). Careful if you're using an external identity account (AD, Office365) or an account with double authentication set on it. then you will have to type an **Application password** ([Comment configurer un mot de passe d'application](#))
- **Click on Connect.**

→ Your computer automatically connects and you can find it in the **SHARED** area.

Notes

A/. Credentials are the same than platform > browser access.

B/. If you loose internet access, drive will keep mounted, you just need to get internet access back to recover access to the content of drive.

C/. **CAREFUL** : your drive will disconnect with every reboot of computer. If you do not wish to redo mount

every time it starts, we advise you to establish an automatic connexion .

Once connected to network drive :

- Click on apple
- Go to System Settings
- Click on tab "Users and groups"
- Select "OPEN from your user profile"
- Add volume (drive letter) by selecting it from the + button
