

February 2025

2025-02-10 - Caroline BOISRAME-MOREAU - Changelog

Improvements

- **The left-hand panel has been redesigned** to help you more easily locate your folders:
 - The **Company space** contains all folders from your organization that you have access to. If you don't have access to their root folder (the very first folder in the hierarchy), the name of the corresponding root folder is displayed next to it so you can identify its origin.
 - The **"Shared with you"** section includes all folders shared with you by users from their private space. The name of the user who shared the folder is indicated. If you no longer need access to a folder, you can leave it by right-clicking on it.

Note: An external user will only see the "Shared with you" section, which includes all folders shared with them.

- **[Administrator] Revamped configuration menu:** easier access to settings to configure your NetExplorer
- **[Administrator] Configurable purge system** for link sharing, email sharing, and upload links has been implemented
(Settings → Features → Link and Email Sharing & Upload)
- **[Administrator] User search now includes group filtering**
- **[Administrator] API:** You can now create OAuth2 applications from the admin interface to authenticate your apps using the NetExplorer API. NetExplorer OAuth2 authentication also enables your users to sign in with their NetExplorer account within third-party apps that support it.

New Applications

- **NetExplorer Connector for Google:**
Google Workspace users can securely share files with NetExplorer directly from Google Drive, Docs, Sheets, or Slides. Your file is automatically stored securely on

NetExplorer and shared via a link with your recipient.

Configure sharing settings: expiration date, password protection, and download receipt.

The connector can be installed or deployed to your entire organization via the Google Workspace Marketplace:

<https://workspace.google.com/marketplace/app/netexplorer/208663681945>

- **NetExplorer Drive:**

The new version of our synchronization tool (formerly NetSync) is now available for Windows and Mac.

Synchronize only the folders you need and reduce the space used on your local machine.

With NetExplorer Drive, your everyday documents are automatically synchronized in real-time on your computer, allowing access at any time—even without an Internet connection.

We strongly recommend following the detailed procedure available [here].

Fixes

- Expired workflows are now displayed as such in the interface
- Bulk user editing is now available for Managers
- A tag can only be permanently deleted by its owner or an administrator, allowing you to retain a tag for future use even if it's no longer in use
